The Arabian oryx, also called the white oryx, was extinct in the wild as of 1972, but was reintroduced to the wild starting in 1982. Initial reintroduction was primarily from two herds: the "World Herd" originally started at the Phoenix Zoo in 1963 from only nine oryx and the Saudi Arabian herd started in 1986 from private collections and some "World Herd" stock by the Saudi National Wildlife Research Center. As of 2009 there have been reintroductions in Oman, Saudi Arabia, Israel, the United Ar

When this book was first published in 1989, attempts to reintroduce plants or animals into their native habitat were still relatively rare, and those that were adequately planned, designed, funded and monitored over the course of years are even scarcer. The oryx story is an exception to this, and has the added interest that it represents the first attempt to re-establish a wild population of a ...

In 1972 it became extinct in the wild, but was saved by zoos and private reserves, and reintroduced into the wild from 1980, and, as a result, wild populations now live in Israel, Saudi Arabia and Oman, and with current additional reintroduction programs taking place, it is likely that this range will expand into other countries of the Arabian Peninsula. Arabian oryx inhabit the deserts and arid plains of Arabia, where temperatures can reach 50°C even in the shade during summer.

Mark has had a long association with the theory and practice of reintroduction. This started with the 1982 release of the Arabian oryx into Oman, using captive-bred animals to replace the last indigenous population which had been hunted to extinction in 1972. From 1988 to 2000 he was founder Chair of the IUCN SSC Reintroduction Specialist Group.

The return of the Arabian oryx Oryx leucoryx to Oman symbolized the success of a new approach to species conservation and established reintroduction as a conservation tool. Ten years after the species had been exterminated in the wild by poaching, the first 10 founder oryx, descendants of the 'World Herd', were reintroduced to the desert in central Oman in January 1982.

The Arabian oryx or white oryx is a medium-sized antelope with a distinct shoulder bump, long, straight horns, and a tufted tail. It is a bovid, and the smallest member of the genus Oryx, native to desert and steppe areas of the Arabian Peninsula. The Arabian oryx was extinct in the wild by the early 1970s, but was saved in zoos and private preserves, and was reintroduced into the wild starting in 1980. In 1986, the Arabian oryx was classified as endangered on the IUCN Red List, and in 2011, it

This book explores the reintroduction of the oryx back into the wild from zoo populations.

Many people know very little about this majestic animal Arabian Oryx (Luecoryx Oryx) that once roam North Africa and Arabian penninsula before 20th century which is now currently being conserved by government Agencies and Private Individual collections. This book lays emphasis on the management of this animal in captivity, reintroduction back to the wild, the effect of conservation effort of this animals on vegetations, lifestyle on host communities, problems this animals might possible face in the wild as a result of the adverse effect of climate change on natural environment, and suggestable possible solutions to the underlying problems in the wild. This book is intended to guide people, students as well as reference materials to existing practitioners. It is hoped that this book will enlarge patronage toward conservation efforts of Arabian Oryx both in captivity and in the wild.

Past progress and future challenges R.J. Wheater Royal Zoological Society of Scotland, Edinburgh, UK. In the past two decades much has been achieved in the sphere of breeding endangered species, and we should be pleased that our co operative efforts have already borne so much fruit. However, on balance and despite the best efforts of conservationists, the position of wildlife in the wild places where they are best conserved has become worse, often dramatically worse. Before returning to the United Kingdom in 1972, I was in Uganda for 16 years, most of which time was spent as Chief Warden of Murchison Falls National Park. Our main problem was that an over-population of large mammals was having a devastating impact on the habitat. Devas tation was being wrought on woodland areas by the arrival of large numbers of elephants into the sanctuary of the Park, following changes in land use in the areas outside the Park. These changes were in response to the requirements of an ever-expanding human population.

Reintroduction of Fish and Wildlife Populations provides a practical step-by-step guide to successfully planning, implementing, and evaluating the reestablishment of animal populations in former habitats or their introduction in new environments. In each chapter, experts in reintroduction biology outline a comprehensive synthesis of core concepts, issues, techniques, and perspectives. This manual and reference supports scientists and managers from fisheries and wildlife professions as they plan reintroductions, initiate releases of individuals, and manage restored populations over time. Covering a broad range of taxonomic groups, ecosystems, and global regions, this edited volume is an essential guide for academics, students, and professionals in natural resource management.

This book aims to further advance the field of reintroduction biology beyond the considerable progress made since the formation of the IUCN/SSC Re-introduction Specialist Group. Using an issue-based framework that purposely avoids a structure based on case studies the book?s central theme is advocating a strategic approach to reintroduction where all actions are guided by explicit theoretical frameworks based on clearly defined objectives. Issues covered include husbandry and intensive management, monitoring, and genetic and health management. Although taxonomically neutral there is a recognised dominance of bird and mammal studies that reflects the published research in this field. The structure and content are designed for use by people wanting to bridge the research-management gap, such as conservation managers wanting to expand their thinking about reintroduction-related decisions, or researchers who seek to make useful applied contributions to reintroduction.

Discusses the current breeding programs and research that has been done in genetics to save animals from extinction, and discusses why this research is necessary

New Scientist magazine was launched in 1956 "for all those men and women who are interested in scientific discovery, and in its industrial, commercial and social consequences". The brand's mission is no different today - for its consumers, New Scientist reports, explores and interprets the results of human endeavour set in the context of society and culture.
