Autosh College (Bengali:) is a college affiliated to the University of Calcutta, situated in Southern Kolkata, close to the Jatin Das Park Metro Station, gate No. 2. It was established in 1916 as the South Suburban College, under the stewardship of educationist Sir Ashutosh Mukherjee, who was the then vice-chancellor of the University of Calcutta.

The Sustainable Future Of Humanity Lies In Understanding The Earth And Its Environment. For This Reason, Environmental Science Has A Purview That Overlaps Several Other Disciplines: From Biology To Economics, Geology To Sociology, Every Subject Has A Significant Relationship With Some Area Of Environmental Science. However, It Is Often Difficult, Time-Consuming And Exhaustive To Keep Pace With New Trends In Such A Broad-Based Field.

'Calcutta Mosaic' explores the history of the diverse immigrant communities of this great city.

This book deals with issues and concerns for the human environment in the developing countries incorporating natural processes and systems, pollution removal technology, energy conservation, environmental impact assessment process, economics, culture, political structure and societal equity from a management point of view. Solutions to the emerging problems of the environment need a paradigmatic shift in approach from a process based model to a socio-political-economic model. Hence environmental management should involve equality and control over use of the finite natural resources and the balance between Earth ' s biocapacity and humanity ' s ecological footprint. Changes such as green technologies, human population stabilization and adoption of ecologically harmonious lifestyles are absolutely essential and will require redesigning of political institutions, policies and revisiting forgotten skills of sustainable practices of environmental management. These challenges should centre on environment governance using the concepts of common property, equity and security. This book is relevant for academics, professionals, administrators and policy makers who are concerned with various aspects of environment management and governance.

Fundamentals of Environmental Studies is taught as a compulsory paper to first-year undergraduate students across major technical universities in India. This book introduces the fundamental principles and concepts of environmental science, ecology and related interdisciplinary subjects, such as policy, law, pollution control, economics and natural resource management. It covers a wide range of topics and issues including biodiversity, global warming, acid rain, ozone layer depletion, nuclear accidents, nuclear holocaust, disaster management, manipulation of various natural resources including water, land, forests, food and mineral resources, and the problems associated with natural resource management. It also analyzes different types of ecosystems, biochemical cycles and laws of thermodynamics and provides easy-to-understand examples. In addition, the book offers separate chapters on various types of environmental pollution and waste management, including waste water treatment, solid waste management and green management.

Microbial Biodegradation and Bioremediation: Techniques and Case Studies for Environmental Pollution, Second Edition describes the successful application of microbes and their derivatives for bioremediation of potentially toxic and relatively novel compounds in the environment. Our natural biodiversity and environment is in danger due to the release of continuously emerging potential pollutants by anthropogenic activities. Though many attempts have been made to eradicate and remediate these noxious elements, thousands of xenobiotics of relatively new entities emerge every day, thus worsening the situation. Primitive microorganisms are highly adaptable to toxic environments, and can reduce the load of toxic elements by their successful transformation and remediation. This completely updated new edition presents many new technologies and techniques and includes theoretical context and case studies in every chapter. Microbial Biodegradation and Bioremediation: Techniques and Case Studies for Environmental Pollution, Second Edition serves as a single-source reference and encompasses all categories of pollutants and their applications in a convenient, comprehensive format for researchers in environmental science and engineering, pollution, environmental microbiology, and biotechnology. Describes many novel approaches of microbial bioremediation including genetic engineering, metagenomics, microbial fuel cell technology, biosurfactants and biofilm-based bioremediation Introduces relatively new hazardous elements and their bioremediation practices including oil spills, military waste water, greenhouse gases, polythene wastes, and more Provides the most advanced techniques in the field of bioremediation, including insitico approach, microbes as pollution indicators, use of bioreactors, techniques of pollution monitoring, and more Completely updated and expanded to include topics and techniques such as genetically engineered bacteria, environmental health, nanoremediation, heavy metals, contaminant transport, and in situ methods Includes theoretical context and case studies within each chapter

As part of the urbanization process, suburban development involves the conversion of rural land to urban use. When discussing the suburbs, most writers focus on particular countries in the northern hemisphere, implying that patterns and processes elsewhere are fundamentally different. The purpose of The Suburban Land Question is to identify the common elements of suburban development, focusing on issues associated with the scale and pace of rapid urbanization around the world. Editors Richard Harris and Ute Lehrer and a diverse group of contributors draw on a variety of sources, including official data, planning documents, newspapers, interviews, photographs, and field observations to explore the pattern, process, and planning of suburban land development. Featuring case studies from major world regions, including China, India, Latin America, South Africa, as well as France, Austria, the Netherlands, the United States, and Canada, the volume identifies and discusses the peculiarly transitional character of suburban land. In addition to place and time, The Suburban Land Question addresses the many elements that distinguish land development in urban fringe areas, including economy, social infrastructure, and legality.

This book focuses on Kolkata, formerly the colonial capital of and currently a major megacity in India, in terms of its extensive blue infrastructures, i.e., its rivers, canals and wetlands as an integrated composite whole. It unfolds ways in which this reclaimed urban space could determine, and in turn, could get determined by political fate, economic calculations and social livelihoods across changing political-economic imperatives and with large-scale implications on urban sustainability. Employing historical urban political ecology (HUPE) as the methodological framework by combining urban environmental history and urban political ecology, the book studies the changing urban environmental equations through several centuries, and its impact on the city and its people. Weaving the past, present and posterity of deltaic Kolkata, the book demonstrates that it is in these ' blue infrastructures ' that the anecdote of origin, the account of functioning and the apprehension of survival of the city is rooted. By emphasizing the ecology ' of ' cities instead of ecology ' in ' cities approach, the book exposes the limitations of contemporary ecological restructuring efforts regarding Indian cities. Further, it offers a blueprint for future innovative and empirical research focusing on other major cities. Accordingly, this topical and original book will be of interest to students and researchers of environmental humanities, political ecology and urban studies.
