Blood, fluid that transports oxygen and nutrients to the cells and carries away carbon dioxide and other waste products.

Technically, blood is a transport liquid pumped by the heart (or an equivalent structure) to all parts of the body, after which it is returned to the heart to repeat the process. Blood is both a tissue and a fluid.

Read Online Composition And Functions Of Blood

Composition of blood and its functions Blood is a suspension of blood elements (erythrocytes, leukocytes, and platelets) in blood plasma. Blood elements can be separated from blood plasma using centrifugal force. Figure shows that the most descended are erythrocytes – the volume of erythrocytes in a sample of blood is called the hematocrit.

1. Composition of Blood and its Functions • Functions of ...
