End-to-end delay or one-way delay (OWD) refers to the time taken for a packet to be transmitted across a network from source to destination. It is a common term in IP network monitoring, and differs from round-trip time (RTT) in that only path in the one direction from source to destination is measured.

Re: End to end QoS. Hi: Yes QoS is setup across the entire network, up to a QoS "boundary". The boundary is where you will setup QoS Categorizations and QoS Marking of cos (802.3 cos bits), dscp (differentiated services code point), and ip precedence (Layer 3 TOS bits), in this case the ethernet port where the server is connected.
