An (n, k) linear code C is called a cyclic code if every cyclic shift of a code vector in C is also a code vector. Codewords can be represented as polynomials of degree n . For a cyclic code all codewords are multiple of some polynomial $g(X)$ modulo X^{n+1} such that $g(X)$ divides X^{n+1} . $g(X)$ is called the generator polynomial. Examples:

This book owes its beginnings to the pioneering work of Claude Shannon in 1948 on reliable communication over noisy transmission channels. Shannon's central theme was that if the signaling rate of the system is less than the channel capacity, reliable communication can be achieved if one chooses proper encoding and decoding techniques.

The 4B/5B block coding discussed in Chapter 4 is a good example of this type of coding. In this coding scheme, $k=4$ and $n=5$. As we saw, we have $2^k = 16$ datawords and $2^n = 32$ codewords. We saw that 16 out of 32 codewords are used for message transfer and the rest are either used for other purposes or unused. 10.15

This is a well written book on the introduction to error control coding. Although now a little bit outdated (lack of all the new development of the 1990's and 2000's, e.g. Turbo code, LDPC code, etc.), it is a good introductory book such that students can build up their foundation for further venture to the error control techniques.
