~~Amazon.com: inline fuel valve~~

Because the fuel pump delivers more fuel to the engine than it needs, a regulator is needed to control the flow. In the older system, fuel travels from the gas tank to the fuel rail using the fuel pump. The top section of the regulator is connected by a small vacuum hose, while a large return hose is

regulated by a pressure control valve (2).

The vane-type pump consists of a eccentric ring (3) and a support ring (4). Excessive pressure from the vane pump is discharged through control valve (2) into the distributor pump housing.

~~Pump-Line-Nozzle Injection System~~

# Read Free Fuel Operated Inline Pressure Control

Safety. Because of the need for positive injection into a very high-pressure environment, the pump develops great pressure—typically 15,000 psi (100 MPa) or more on newer systems. This is a good reason to take great care when working on diesel systems; escaping fuel at this sort of pressure can easily penetrate skin and
