Excerpt from Research Paper : Multiple sclerosis is an inflammatory disease. It affects the brain and spinal cord, and damages the covers that insulate the nerve cells. When these covers are damaged, the nervous system experiences a breakdown in communication. This causes a wide range of symptoms and signs that can affect numerous areas of the body. Mental and physical problems appear, along with a host of psychiatric issues in some patients.

~~Research Paper on Multiple Sclerosis | How to write ...~~

OBJECTIVE: To verify the hypothesis of an age-dependent increase of infections and neoplasms in patients with multiple sclerosis (MS) under disease-modifying treatments (DMTs) with different mechanisms of action. METHODS: We extracted relevant data from 45 randomized clinical trials (RCTs) on currently licensed DMTs. We fitted inverse-variance weighted meta-regressions with random-effects models to estimate whether age and/or mechanism of action (immunomodulatory, sequestering, and ...

Multiple sclerosis (MS) is a chronic inflammatory autoimmune disease of the central nervous system, usually presenting as a clinically isolated syndrome (CIS). Not all patients convert to clinically definite MS, and in those who do the level of disability accumulation is highly variable. 1 Validated long-term prognostic markers are therefore important in guiding the therapeutic choices for individual patients.
