Comprehensive Sampling and Sample Preparation is a complete treatment of the theory and methodology of sampling in all physical phases and the theory of sample preparation for all major extraction techniques. It is the perfect starting point for researchers and students to design and implement their experiments and support those experiments with quality-reviewed background information.

That sample preparation often involves grinding to a particle size appropriate for analysis then storage prior to analysis, both of which must be done in ways to prevent sample degradation. The principles described in this chapter are intended to provide a basis for understanding, developing, and evaluating sampling plans and sample handling procedures for specific food analysis

The purpose of sample preparation is to have a processed sample that leads to better analytical results compared to the initial sample. This can be achieved by having a processed sample easier to introduce in the core analytical system, with fewer matrix components (cleaner sample), more concentrated in analytes, chemically modified to enhance the separation and the detection in the core analytical system, etc.

Such preparation steps may include homogenization or sample heating. The addition of tracers or carriers prior to these steps helps to account for any analyte loss during sample preparation.
